□ AI-Driven Customer Purchase Behavior Analysis Report

---

1. Project Overview

This project focuses on analyzing customer demographic and purchasing data to understand patterns that influence spending behavior. The goal is to transform raw data into meaningful insights that can support business decision-making and future machine learning applications.

The analysis follows a structured workflow including data preprocessing, exploratory data analysis (EDA), multivariate analysis, and introductory modeling.

---

2. Objective

The main objectives of this project are:

- Analyze customer purchase behavior using demographic and transaction data
- Identify key factors that influence purchase amount
- Explore relationships between different variables
- Generate insights to support business strategies
- Evaluate the dataset for potential machine learning applications

---

3. Tools & Technologies Used

- Python
- Pandas
- NumPy
- Matplotlib
- Seaborn
- Jupyter Notebook
- Scikit-learn

---

4. Dataset Description

The dataset contains customer-level information including:

- **CustomerID** – unique identifier
- **Age** – customer age

- **Gender** – customer gender
- **PurchaseAmount** – amount spent
- **ProductCategory** – category of purchased product

The dataset was used to analyze how demographic and behavioral factors impact spending patterns.

---

5. Data Preprocessing

The following steps were performed to prepare the data:

- Removed duplicate records to ensure data quality
- Checked for missing values and ensured data completeness
- Converted categorical variables such as Gender and ProductCategory into appropriate formats
- Verified data types and structure

These steps ensured that the dataset was clean and ready for analysis.

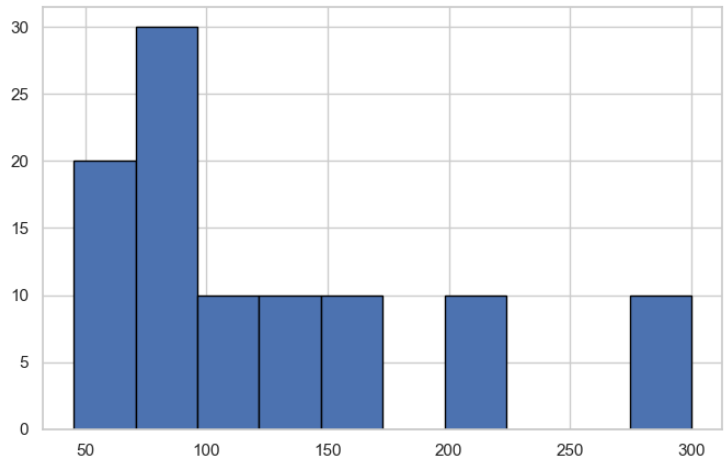
---

6. Exploratory Data Analysis (EDA)

6.1 Univariate Analysis

Univariate analysis was used to examine individual variables.

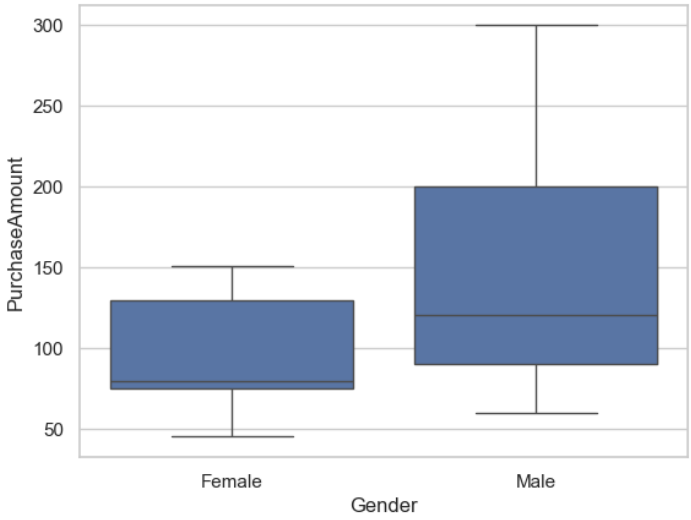
- Age distribution showed a balanced spread across different age groups
- Purchase amount distribution revealed variation in customer spending, including high-value transactions
- Product category distribution indicated differences in customer preferences



6.2 Bivariate Analysis

Bivariate analysis helped identify relationships between variables.

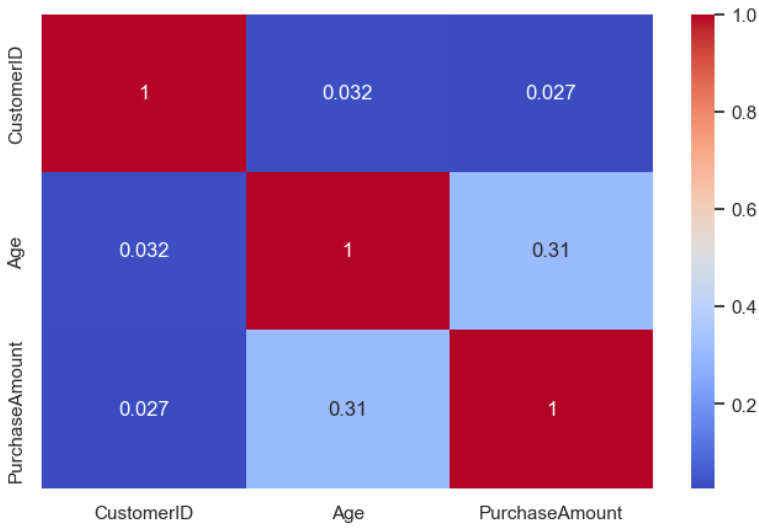
- Product category showed a strong relationship with purchase amount
- Electronics and Home categories had higher average spending
- Gender showed moderate differences in spending patterns
- Age vs purchase analysis indicated some variation but not a strong trend



6.3 Multivariate Analysis

Multivariate analysis was performed to examine relationships among multiple variables.

- Correlation analysis showed limited strong relationships between numeric variables
- Product category emerged as a key influencing factor
- Combined analysis of demographic and behavioral features provided deeper insights into spending patterns



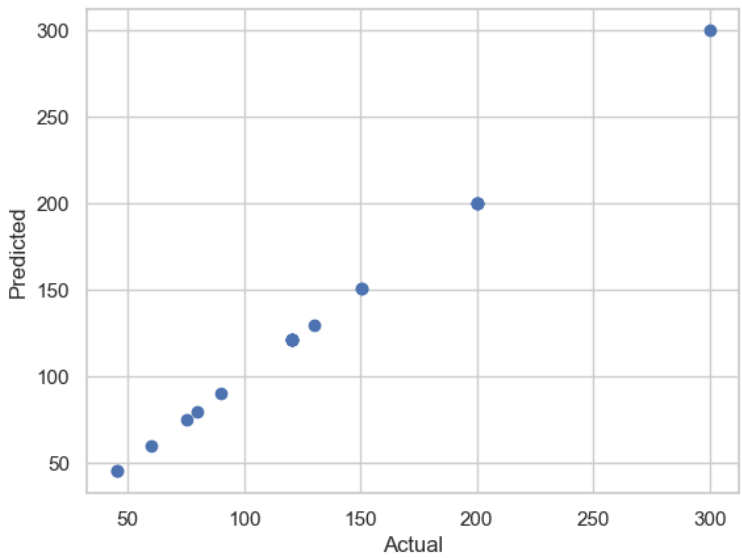
7. Modeling

A basic machine learning model was implemented to evaluate predictive capability.

- A Random Forest Regressor was used to predict purchase amount
- The dataset was split into training and testing sets
- Model performance was evaluated using RMSE and R^2

Key Observation

The model demonstrated that purchase amount can be reasonably predicted using available features, indicating the dataset is suitable for machine learning applications.



---

8. Key Insights

- Product category is the strongest factor influencing purchase amount
- Customers purchasing Electronics and Home products tend to spend more
- Demographic factors such as age and gender have moderate impact
- Purchase data shows variation across categories and customer groups
- The dataset has strong potential for predictive modeling and segmentation

---

9. Business Insights & Recommendations

The analysis suggests that businesses should focus more on product-driven strategies rather than relying only on demographic segmentation.

Key Recommendations:

- Focus marketing efforts on high-value product categories such as Electronics
- Use purchase behavior data for customer segmentation
- Apply predictive models to forecast customer spending
- Improve personalization strategies based on purchasing patterns

---

10. Conclusion

This project demonstrates a complete data analysis workflow, including data preprocessing, exploratory analysis, multivariate analysis, and introductory modeling.

The results provide valuable insights into customer behavior and establish a foundation for future AI and machine learning applications such as purchase prediction and customer segmentation.
